## PIPERAZINE DERIVATIVES AND THEIR USE AS ANTI-INFLAMMATORY AGENTS

### Field of the Invention

5

The present invention is directed to piperazine derivatives and their pharmaceutically acceptable salts, which inhibit the activity of the chemokines, MIP-1 $\alpha$  and RANTES, thereby being useful as anti-inflammatory agents. It also relates to pharmaceutical compositions containing the derivatives or their pharmaceutically acceptable salts, and methods of their use.

10

### BACKGROUND OF THE INVENTION

An important component of the inflammatory process involves the migration and activation of select populations of leukocytes from the circulation and their accumulation in the affected tissue. While the idea of leukocyte trafficking is not new, it has enjoyed a renaissance recently following the discovery and characterization of the selectin and integrin families of adhesion molecules and the large family of selective chemotatic cytokines known as chemokines. Chemokine receptors are expressed on leukocytes and process the signals following the binding of the chemokine whereby such signals are eventually transduced into migration or activation of the leukocytes towards the source of the chemokine. Therefore, by regulating the migration and activation of leukocytes from the peripheral blood to extravascular sites in organs, skin, articulations or connective tissue, chemokines play a critical role in the maintenance of host defense as well as in the development of the immune response.

Originally, the chemokine family of molecules was divided into two groups: the "C-X-C" subfamily and the "C-C" subfamily. The characteristic feature of both of these subfamilies is the presence of four cysteine residues in highly conserved positions in the molecules. In the "C-C" chemokine subfamily, the first two residues are adjacent to each other, while in the "C-X-C" subfamily, the cysteine residues are separated by a single amino acid residue. A recent description of a "-C-" chemokine appears to represent a new family of chemokines in that the "-C-" chemokine lacks two of the four cysteine residues present in the "C-C" subfamily or the "C-X-C" subfamily.

30

-2-

One member of the "C-C" subfamily of chemokines is macrophage inflammatory protein-1 $\alpha$  ("MIP-1 $\alpha$ "). It is expressed by cells such as macrophages, T and B lymphocytes, neutrophils and fibroblasts. A recent study (see Karpus, W.J. *et al.*, *J. Immunol.* (1995), Vol. 155, pp. 5003-5010) provides strong *in vivo* concept validation for a role of MIP-1 $\alpha$  in a mouse experimental autoimmune encephalomyelitis (EAE) model of multiple sclerosis. Multiple sclerosis is an autoimmune disease mediated by T and B lymphocytes and macrophages, resulting in extensive inflammation and demyelination of white matter in the central nervous system. The study showed that antibodies to MIP-1 $\alpha$  prevented the development of both initial and relapsing disease as well as preventing the infiltration of mononuclear cells into the central nervous system. Treatment with the antibodies was also able to ameliorate the severity of ongoing clinical disease. These results led the investigators to conclude that MIP-1 $\alpha$  plays an important role in the etiology of multiple sclerosis. In addition, another study (see Godiska, R. *et al.*, *J. Neuroimmunology* (1995), Vol. 58, pp. 167-176) demonstrated an upregulation of mRNA for a number of chemokines, including MIP-1 $\alpha$ , in the lesions and spinal cord of SJL mice (a strain of mice susceptible to Th<sub>1</sub> diseases such as EAE) during the course of acute EAE.

RANTES is another member of the C-C chemokine subfamily (the name RANTES is an acronym derived from some of the original observed and predicted characteristics of the protein and its gene: Regulated upon Activation Normal T cell Expressed presumed Secreted). A wide variety of tissues have been found to express RANTES in a similar pattern to MIP-1 $\alpha$ . Strong evidence exists linking RANTES to organ transplant rejection, particularly of the kidney. The infiltration of mononuclear cells into the interstitium of organ transplants is the hallmark of acute cellular rejection. This cellular infiltrate primarily consists of T cells, macrophages and eosinophils. In a study of RANTES expression during acute renal allograft rejection, RANTES mRNA expression was found in infiltrating mononuclear cells and renal tubular epithelial cells and RANTES itself was found to be bound to the endothelial surface of the microvasculature within the rejecting graft (see Pattison, J. *et al.*, *Lancet* (1994), Vol. 343, pp. 209-211 and Wiedermann, C.J. *et al.*, *Curr. Biol.* (1993), Vol. 3, pp. 735-739).

There is also evidence from a number of studies to implicate the abnormal production of RANTES in the progression of rheumatoid arthritis (see Rathanaswami, P. *et al.*, *J. Biol. Chem.*

-3-

(1993), Vol. 268, pp. 5834-5839 and Snowden, N. *et al.*, *Lancet* (1994), Vol. 343, pp. 547-548). Rheumatoid arthritis is a chronic inflammatory disease characterized in part by a memory T lymphocyte and monocyte infiltration, which is believed to be mediated by chemotactic factors released by inflamed tissues.

5           In addition, there is strong evidence from other studies implicating RANTES in the pathophysiology of rheumatoid arthritis (see Barnes, D.A. *et al.*, *J. Clin. Invest.* (1998, in press) and Plater-Zyberk, C.A. *et al.*, *Immunol. Lett.* (1997), Vol. 57, pp. 117-120). For example, in an adjuvant-induced arthritis (AIA) model in the rat, antibodies to RANTES greatly reduced the development of disease in rats induced for AIA.

10           These studies and others provide strong evidence that MIP-1 $\alpha$  levels are increased in EAE models of multiple sclerosis and that RANTES levels are increased in rheumatoid arthritis and kidney transplant rejection (see, e.g., Glabinski, A.R. *et al.*, *Am. J. Pathol.* (1997), Vol. 150, pp. 617-630; Glabinski, A.R. *et al.*, *Methods. Enzymol.* (1997), Vol. 288, 182-190; and Miyagishi, R.S. *et al.*, *J. Neuroimmunol.* (1997), Vol. 77, pp. 17-26). In addition, as described  
15           above, these chemokines are chemoattractants for T cells and monocytes which are the major cell types that are involved in the pathophysiology of these diseases. Therefore, any molecule that inhibits the activity of either of these chemokines would be beneficial in treating these diseases and would therefore be useful as an anti-inflammatory agent.

10 characterized by migration, accumulation and activation of leukocytes to the affected tissue. The amount of a compound of formula (I) which constitutes a "therapeutically effective amount" will vary depending on the compound, the disorder and its severity, and the age of the human to be treated, but can be determined routinely by one of ordinary skill in the art having regard to his own knowledge and to this disclosure.

The compounds of the invention, or their pharmaceutically acceptable salts, may have asymmetric carbon atoms in their structure. 30 mixtures thereof are intended to be within the scope of this invention. Absolute configuration of

-35-

- 10 the following formula:

- is named herein as 1-(2-((4-methoxynaphthalen-1-yl)oxy)ethyl)carbonyl-2-ethoxycarbonyl-4-(4-
- 15 (2-(ethylamino)ethyl)benzyl)piperazine.

## Utility and Administration

### A. Utility

- The compounds of the invention inhibit
- 20 the activity of the chemokines MIP-1 $\alpha$  and RANTES and are therefore useful as anti-inflammatory agents. In particular, the compounds are useful in treating inflammatory disorders such as multiple sclerosis, leukoencephalopathy, encephalomyelitis, Alzheimer's disease, Guillian-Barre syndrome, acute cell-mediated renal transplant rejection, allograft rejection, rheumatoid arthritis, atherosclerosis, uricaria, angioderma, allergic conjunctivitis, atopic
- 25 dermatitis, allergic contact dermatitis, drug or insect sting allergy or systemic anaphylaxis. Of particular interest to the invention is the use of the compounds to treat multiple sclerosis.

## B. Testing

To demonstrate that the compounds inhibit the activity of MIP-1 $\alpha$  or RANTES several assays may be employed. One assay utilizes a microphysiometer, which uses a patented silicon-based light addressable potentiometric sensor to continuously monitor subtle changes in extracellular pH levels. These changes result from the generation of acidic metabolites excreted by living cells into their immediate microenvironment during basal and stimulated conditions. It has been previously demonstrated by microphysiometry that THP-1 cells, which have been shown to express the chemokine receptors, CCR1 and CCR2, respond dose-responsively to their respective chemokines, including MIP-1 $\alpha$ , RANTES and MCP-1 (a ligand for CCR2). See, e.g., Hirst, M. *et al.*, "Chemokine receptors," *Journal of NIH Research* (1995), Vol. 80.

Another assay which may be used to demonstrate the ability of the compounds to inhibit the activity of MIP-1 $\alpha$  and RANTES is based on the measurement of intracellular Ca<sup>2+</sup> concentrations and/or increases in intracellular [<sup>3</sup>H] inositol phosphate release from MIP-1 $\alpha$  and RANTES stimulated cells. Ligand binding to the CCR1 receptor results in G-protein induced activation of phospholipase C, which leads to the conversion of phosphatidyl inositol phosphate to inositol phosphate and diacylglycerol. Inositol phosphate in turn binds to a receptor located at intracellular sites to release Ca<sup>2+</sup> into the cytoplasm. In addition to Ca<sup>2+</sup> concentration increases due to release from intracellular stores, binding of inositol phosphate to its receptor leads to an increased flux of extracellular calcium across the membrane and into the cell. Thus the activation of the CCR1 receptor by MIP-1 $\alpha$  and RANTES and, subsequently, inhibition of the activation by the compounds of the invention can be determined by assaying for an increase in free intracellular Ca<sup>2+</sup> levels. Typically this can be achieved by the use of calcium-sensitive fluorescent probes such as quin-2, fura-2 and indo-1. Alternatively, functional activation or inhibition of the activation of the CCR1 receptor can be measured by quantitation of [<sup>3</sup>H] inositol phosphate release from the cell pre-labeled with [<sup>3</sup>H] inositol.

Standard *in vitro* binding assays may be employed to demonstrate the affinity of the compounds for the CCR1 receptor (thereby inhibiting the activity of MIP-1 $\alpha$  and RANTES by competitive binding to the receptor). See, e.g., Neote, K. *et al.*, *Cell* (1993), Vol. 72, pp. 415-

-37-

425. One particular assay employs the use of HEK293 cells which have been stably transfected to express human CCR1 receptor.

Standard *in vivo* assays which may be employed to demonstrate the compounds usefulness as anti-inflammatory agents are the animal model for experimental autoimmune encephalomyelitis (EAE) model for multiple sclerosis and the adjuvant-induced arthritis (AIA) model for rheumatoid arthritis.

### C. General Administration

Administration of the compounds of the invention, or their pharmaceutically acceptable salts, in pure form or in an appropriate pharmaceutical composition, can be carried out *via* any of the accepted modes of administration or agents for serving similar utilities. Thus, administration can be, for example, orally, nasally, parenterally, topically, transdermally, or rectally, sublingually, intramuscular, subcutaneously, or intravenously in the form of solid, semi-solid, lyophilized powder, or liquid dosage forms, such as for example, tablets, suppositories, pills, soft elastic and hard gelatin capsules, powders, solutions, suspensions, or aerosols, or the like, preferably in unit dosage forms suitable for simple administration of precise dosages. The compositions will include a conventional pharmaceutical carrier or excipient and a compound of the invention as the/an active agent, and, in addition, may include other medicinal agents, pharmaceutical agents, carriers, adjuvants, etc.

Generally, depending on the intended mode of administration, the pharmaceutically acceptable compositions will contain about 1% to about 99% by weight of a compound(s) of the invention, or a pharmaceutically acceptable salt thereof, and 99% to 1% by weight of one or more suitable pharmaceutical excipient(s). Preferably, the composition will be about 5% to 75% by weight of a compound(s) of the invention, or a pharmaceutically acceptable salt thereof, with the rest being suitable pharmaceutical excipients.

The preferred route of administration is oral, using a convenient daily dosage regimen which can be adjusted according to the degree of severity of the disease-state to be treated. For such oral administration, a pharmaceutically acceptable composition containing a compound(s) of the invention, or a pharmaceutically acceptable salt thereof, is formed by the incorporation of any of the normally employed excipients. Such excipients include non-toxic and chemically compatible fillers, binders, disintegrants, buffers, preservatives, anti-oxidants,

-38-

lubricants, flavorings, thickeners, coloring agents, emulsifiers, and the like, for example, pharmaceutical grades of mannitol, lactose, starch, pregelatinized starch, magnesium stearate, sodium saccharine, talcum, cellulose ether derivatives, glucose, gelatin, sucrose, citrate, cyclodextrin, propyl gallate, and the like. Such compositions take the form of solutions, suspensions, tablets, pills, capsules, powders, sustained release formulations and the like.

Preferably such compositions will take the form of capsule, caplet or tablet and therefore will also contain a diluent such as lactose, sucrose, dicalcium phosphate, and the like; a disintegrant such as croscarmellose sodium or derivatives thereof; a lubricant such as magnesium stearate and the like; and a binder such as a starch, gum acacia, polyvinylpyrrolidone, gelatin, cellulose ether derivatives, and the like.

The compounds of the invention, or their pharmaceutically acceptable salts, may also be formulated into a suppository using, for example, about 0.5% to about 50% active ingredient disposed in a carrier that slowly dissolves within the body, e.g., polyoxyethylene glycols and polyethylene glycols (PEG), e.g., PEG 1000 (96%) and PEG 4000 (4%), and propylene glycol.

Liquid pharmaceutically administrable compositions can, for example, be prepared by dissolving, dispersing, etc., a compound(s) of the invention (about 0.5% to about 20%), or a pharmaceutically acceptable salt thereof, and optional pharmaceutical adjuvants in a carrier, such as, for example, water, saline, aqueous dextrose, aqueous cyclodextrin, glycerol, ethanol and the like, to thereby form a solution or suspension.

If desired, a pharmaceutical composition of the invention may also contain minor amounts of auxiliary substances such as wetting or emulsifying agents, pH buffering agents, antioxidants, and the like, such as, for example, citric acid, sorbitan monolaurate, triethanolamine oleate, butylated hydroxytoluene, etc.

Actual methods of preparing such dosage forms are known, or will be apparent, to those skilled in this art; for example, see *Remington's Pharmaceutical Sciences*, 18th Ed., (Mack Publishing Company, Easton, Pennsylvania, 1990). The composition to be administered will, in any event, contain a therapeutically effective amount of a compound of the invention, or a pharmaceutically acceptable salt thereof, for treatment of an inflammatory disorder alleviated by the inhibition of the activity of the chemokines, MIP-1 $\alpha$  and RANTES.

The compounds of the invention, or their pharmaceutically acceptable salts, are administered in a therapeutically effective amount which will vary depending upon a variety of

factors including the activity of the specific compound employed, the metabolic stability and length of action of the compound, the age, body weight, general health, sex, diet, mode and time of administration, rate of excretion, drug combination, the severity of the particular disease-states, and the host undergoing therapy. Generally, a therapeutically effective daily  
5 dose is from about 0.014 mg to about 14.0 mg/kg of body weight per day of a compound of the invention, or a pharmaceutically acceptable salt thereof; preferably, from about 0.14 mg to about 10.0 mg/kg of body weight per day; and most preferably, from about 1.4 mg to about 7.0 mg/kg of body weight per day. For example, for administration to a 70 kg person, the dosage range would be from about 1.0 mg to about 1.0 gram per day of a compound of the invention,  
10 or a pharmaceutically acceptable salt thereof, preferably from about 10 mg to about 700 mg per day, and most preferably from about 100 mg to about 500 mg per day.

### Preparation of Compounds of The Invention

5           The following Reaction Schemes are directed to the preparation of compounds of formula (Ia), formula (Ib) and formula (Ic). It is understood that those compounds of the invention which are not specifically prepared in the following Reaction Schemes may be prepared by similar synthetic processes with the appropriately substituted starting materials and reagents. It is also understood that in the following descriptions, combinations of the various  
10       substituents (e.g., R<sup>1a</sup>, R<sup>2</sup> and R<sup>3</sup> substituents) on the depicted formulae are permissible only if such combinations result in stable compounds.

For the purposes of convenience only, preparation of compounds of the invention where R<sup>3</sup> is only phenyl are illustrated below. It is understood that other R<sup>3</sup> groups (including other carbocyclic and heterocyclic ring systems) may be prepared in a similar manner.

15           It is also understood that during the preparation of the compounds of the invention, as described below, additional reactive groups (for example, hydroxy, amino or carboxy groups) on the intermediate compounds utilized in the preparation may be protected as needed by the appropriate protecting group by treating the intermediate compound prior to the desired reaction with the appropriate protecting group precursor by methods known to those of ordinary skill in  
20       the art. The protecting groups may then be removed as desired by methods known to those of ordinary skill in the art, for example, by acidic or basic hydrolysis. Such protecting groups and methods are described in detail in Greene, T.W. and Wuts, P.G.M., "Protective Groups in Organic Synthesis", 2nd Edition, 1991, John Wiley & Sons. Also, dimethylpiperazines can be prepared in an asymmetric synthesis according to the method outlined in Mickelson, J.W.,  
25       Belonga, K.L., Jacobsen, E.J., *Journal of Organic Chemistry* (1995), Vol. 60, pp. 4177-4123.

It should be noted that the only difference in the two groups of compounds covered by formula (Ia) and formula (Ib) as described above in the Summary of the Invention is the required substitution of the piperazine ring in the compounds of formula (Ia). Accordingly, it is understood that, unless otherwise indicated, the following Reaction Schemes directed to the  
30       preparation of the compounds of formula (Ia) may be used to prepare compounds of formula

-75-

(Ib), and the following Reaction Schemes directed to the preparation of the compounds of formula (Ib) may be used to prepare compounds of formula (Ia).

In addition, compounds of formula (Id) may be prepared in a similar manner as those described herein for compounds of formula (Ia) and (Ib).

**A. Preparation of Compounds of Formula (C)**

**Reaction Scheme 1**

5        The compounds of formula (A) and formula (B) are commercially available, e.g., from Aldrich Chemical Co. or Sigma Chemical Co., or may be prepared according to methods known to those of ordinary skill in the art.

10        In general, the compounds of formula (C) are prepared by treating a compound of formula (A) in an organic solvent, such as methylene chloride, with an equimolar amount of a compound of formula (B). The reaction mixture is stirred for about 10 to 20 hours at ambient temperature. The reaction mixture is then concentrated to afford a residue which is dissolved in an organic solvent. -78-

In general, compounds of formula (Ga) and formula (Gb) are prepared by first treating a compound of formula (D) in an anhydrous aprotic solvent, such as anhydrous ether, with an equimolar amount of a compound of formula (E) in an anhydrous aprotic solvent, such as anhydrous ether, over a period of time, for example, over a two hour period. The resulting reaction mixture is stirred for about 2 to about 4 hours, preferably for about 3 hours, at ambient temperature. The compound of formula (F) is isolated from the reaction mixture by standard isolation techniques, such as concentration of the product and purification by vacuum distillation.

To a solution of a strong reducing agent, such as lithium aluminum hydride, in an anhydrous polar aprotic solvent, such as tetrahydrofuran, is added the compound of formula (F). The resulting mixture is stirred at ambient temperature for about 30 minutes to about 2 hours, preferably for about 1 hour. The mixture is then heated to reflux to complete the reaction. Upon completion, the compound of formula (Ga) is isolated from the reaction mixture by standard isolation techniques, such as quenching by water and a mild base, followed by filtration.

Alternatively, to a solution of formula (F) in a polar protic solvent, such as absolute ethanol, is added a solid alkaline metal, such as sodium metal over a period of time, such as over a 3 hour period. The resulting mixture is heated to reflux for about 2 to about 4 hours, preferably for about 3 hours. The compound of formula (Gb) is distilled from the reaction mixture by the addition of water to the reaction mixture. The distillate is then treated with an aqueous acid, such as hydrochloric acid, to form the salt of the compound of formula (Gb).

Compounds of formula (Ga) and formula (Gb) may then be treated with compounds of formula (B) in a manner similar to that described above in Reaction Scheme 1 to produce compounds of the invention wherein the relative orientation of the  $R^{1a}$  substituents is fixed.

Reaction Scheme 4 continued

Compounds of formula (L) wherein the  $R^{1b}$  substituent contains an un-protected hydroxy group may be protected with the appropriate oxygen-protecting group prior to the synthesis of the compound of formula (M). Removal of the protecting group may be performed as desired.

In general, the compounds of formula (Ia) are prepared by first esterifying a compound of formula (L) by treating the compound with an excess molar amount of a lower alcohol, preferably methanol, in the presence of an acid, preferably hydrochloride gas, at about 0°C to ambient temperature. The resulting mixture is then stirred at about 0°C to reflux temperature, preferably at ambient temperature, for about 4 hours to about 18 hours. The mixture is then concentrated by removal of solvents to produce the compound of formula (M).

To a solution of the compound of formula (M) in an organic solvent, such as methanol, at about 0°C to ambient temperature, is added an excess molar amount of a compound of

-85-

formula (N), and then treated with a mild acid, such as acetic acid, and stirred at ambient temperature for about 2 hours to about 4 hours, preferably for about 3 hours, to form an intermediate imine. The imine is then reduced *in situ* by treatment with a reducing agent, such as sodium cyanoborohydride, to produce a compound of formula (O), which is isolated from the reaction mixture by standard isolation techniques, such as filtration and purification by flash column chromatography.

To a solution of a compound of formula (P) in a polar aprotic solvent, such as anhydrous tetrahydrofuran, is added an acid scavenging mild base, such as *N*-methymorpholine, followed by the addition of an acid coupling reagent, such as isobutylchloroformate. The resulting mixture is stirred at about 0°C to ambient temperature for about 15 minutes to about 2 hours, preferably for about 15 minutes at 0°C and then for about an hour at ambient temperature, to form an intermediate active ester of the compound of formula (P). The intermediate is then treated *in situ* with a compound of formula (O) in anhydrous polar aprotic solvent, such as anhydrous tetrahydrofuran and the resulting mixture is stirred at ambient temperature for about 10 hours to about 24 hours, preferably for about 15 hours. The compound of formula (Q) is isolated from the reaction mixture by standard isolation techniques, such as concentration, organic phase separation and purification by flash column chromatography.

The compound of formula (Q) in an aprotic solvent, such as methylene chloride, at about 0°C, is then treated with a strong organic acid, such as trifluoroacetic acid, for a period of about 2 to about 4 hours, preferably for about 2 hours, to remove the protecting group on the nitrogen atom, followed by spontaneous cyclization to form the compound of formula (R), which is isolated from the reaction mixture by standard isolation techniques, such as neutralization with a mild base, filtration and concentration.

The compound of formula (R) in an anhydrous polar aprotic solvent, such as anhydrous tetrahydrofuran, at about 0°C is treated with a strong reducing agent, such as lithium aluminum hydride. The resulting mixture is then heated to reflux for about 12 hours to about 24 hours, preferably for about 15 hours. The mixture is then cooled to ambient temperature and the reaction quenched with water, followed by aqueous base, preferably aqueous potassium hydroxide. The resulting mixture is allowed to stir at ambient temperature for about 30 minutes

-86-

to an hour. The compound of formula (S) is then isolated from the reaction mixture by filtration and concentration.

The compound of formula (S) in a polar aprotic solvent, such as methylene chloride, in the presence of excess amount of an acid scavenging base, such as triethylamine, is added a slightly excess molar amount of a compound of formula (J) in a polar aprotic solvent, such as methylene chloride. The resulting mixture is stirred at ambient temperature for about 15 minutes to about 1 hour, preferably for about 15 minutes. The compound of formula (Ia) is then isolated from the reaction mixture by standard isolation techniques, such as extraction, concentration and flash column chromatography.

In general, the compounds of formula (Ib) prepared by this Reaction Scheme are prepared by first treating a compound of formula (X) in an organic solvent, such as toluene, with phosgene for a period of time from about 1 hour to about 24 hours, preferably for about 2 hours, at reflux temperature to form the isocyanate of formula (Y), which is isolated from the reaction mixture by standard isolation techniques, such as concentration and filtration.

The compound of formula (Y) in an anhydrous aprotic polar solvent, such as tetrahydrofuran, is then treated with an equimolar amount of a compound of formula (C). The resulting mixture is stirred at ambient temperature for about 10 hours to about 48 hours, preferably for about 20 hours. The compound of formula (Ib) is then isolated from the reaction mixture by standard isolation techniques, such as concentration and evaporation of solvents.

**Reaction Scheme 8**

Compounds of formula (Ib) are prepared as disclosed herein and compounds of formula  $R^9Y$  are commercially available, for example, Aldrich Chemical Co. or Sigma Chemical Co., or may be prepared according to methods known to those of ordinary skill in the art.

In general, compounds of formula (Ic) are prepared by first treating a compound of formula (Ib) in a non-polar organic solvent, such as toluene, with an excess molar amount of a compound of formula  $R^9Y$ . The resulting mixture is stirred at ambient temperature for about 1 to 10 days, preferably for about 6 days. The compound of formula (Ic) precipitates out of the solution as the quaternary salt and is isolated by standard isolation techniques such as filtration.

The counterion  $Y^{-}$  may be exchanged with other counterions by methods known to those of ordinary skill in the art.

In addition to the foregoing Reaction Schemes 1 through 8, other compounds of invention may be made by reactions known to one skilled in the art. For example, a compound of formula (Ia), formula (Ib), formula (Ic), or formula (Id), or any appropriately substituted starting material or intermediate thereof, wherein at least one  $R^{1a}$  substituent or at least one  $R^{1b}$  substituent is selected from the group consisting of hydroxyalkyl, hydroxyalkenyl, hydroxyalkynyl, (hydroxy)aralkyl, (hydroxy)cycloalkylalkyl, hydroxyalkylthioalkyl, and hydroxyalkylaminoalkyl, may be dissolved in an aprotic polar solvent, such as methylene

-94-

chloride, in the presence of a mild acid scavenging base and then treated with a slightly excess molar amount of a sulfonyl halide, such as sulfonyl chloride, to form an intermediate compound containing a sulfonate leaving group. The compound may then be dissolved in an anhydrous aprotic solvent, such as dimethylformamide, and treated, in the presence of a mild base, with the appropriate nucleophilic reagent to form compounds of formula (Ia), formula (Ib) or formula (Ic), or any appropriately substituted starting material or intermediate thereof, wherein the R<sup>1a</sup> substituent or the R<sup>1b</sup> substituent (depending on the nucleophilic reagent utilized) may be selected from the group consisting of heterocyclalkyl, monoalkylaminoalkyl, dialkylaminoalkyl, cycloalkylamino, cyanoalkyl, (cycloalkylalkyl)aminoalkyl, or hydroxyalkylthioalkyl.

Alternatively, a compound of formula (Ia), formula (Ib), formula (Ic), or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contains a hydroxy group, such as hydroxyalkyl, hydroxyalkenyl, hydroxyalkynyl, (hydroxy)aralkyl, (hydroxy)cycloalkylalkyl, hydroxyalkylthioalkyl, and hydroxyalkylaminoalkyl, may be treated with a mild oxidizing agent, such as oxalyl chloride, which is dissolved in an inert organic solvent, such as methylene chloride, to which DMSO is added over a period of time at about -60°C to about 0°C, preferably at about -50°C. The reaction mixture is stirred at about -60°C to about 0°C for about 15 minutes to about an hour, preferably for about 15 minutes, and then a mild base, such as triethylamine, is added to the mixture. The mixture is allowed to gradually warm to ambient temperature, at which point the oxidized compound (*i.e.*, the corresponding aldehyde) of formula (Ia), formula (Ib), or formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, is isolated from the reaction mixture by standard isolation techniques.

Alternatively, a compound of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contains an aldehyde or a ketone group, such as formyl, alkylcarbonyl or alkylcarbonylalkyl, may be treated with the appropriate organometallic reagent, such as an organomagnesium or organolithium, under standard Grignard synthesis reaction conditions to form the corresponding hydroxy-substituted compounds.

Alternatively, a compound of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contains a hydroxy

group, such as hydroxyalkyl, hydroxyalkenyl, hydroxyalkynyl, (hydroxy)aralkyl, (hydroxy)cycloalkylalkyl, hydroxyalkylthioalkyl, and hydroxyalkylaminoalkyl, in an anhydrous polar solvent, such as anhydrous ether, in the presence of a strong base, such as sodium hydride, may be treated with an alkyl halide, such as methyl iodide, at ambient temperatures, to  
5 form the corresponding alkoxy-substituted compounds.

Alternatively, a compound of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, wherein at least one  $R^{1a}$  substituent or at least one  $R^{1b}$  substituent is formyl or formylalkyl, may be reacted with a primary or secondary amine, under the reductive amination conditions as described above for  
10 the preparation of the compounds of formula (O) or the compounds of formula (Ib) as prepared in Reaction Scheme 6 to form the corresponding compounds of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, wherein the  $R^{1a}$  substituent or the  $R^{1b}$  substituent is monoalkylaminoalkyl, dialkylaminoalkyl, monoaralkylaminoalkyl, or hydroxyalkylaminoalkyl.

Alternatively, a compound of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contains an ester group, such as an alkoxycarbonyl, aryloxycarbonyl or aralkoxycarbonyl group, may be subjected to standard basic hydrolysis conditions, to form the corresponding compound of  
15 formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contains an acid group, i.e. a carboxy group.

Alternatively, a compound of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, wherein  $R^6$  is  $-C(O)-$  may be reduced to the corresponding compound of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, wherein  $R^6$  is  
20  $-CH_2-$  by methods known to those of ordinary skill in the art, for example, by the method described above for compounds of formula (S).

In addition, compounds of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, wherein  $R^6$  is  $-C(O)-$  may be converted to a compound of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any  
25 appropriately substituted starting material or intermediate thereof, wherein  $R^6$  is  $-C(S)-$  by  
30

treatment with Lawesson's Reagent under standard conditions known to those of ordinary skill in the art.

In addition, compounds of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contain an unoxidized sulfur atom may be oxidized with the appropriate sulfur oxidizing agent according to methods  
5 known to those skilled in the art, such as using hydrogen peroxide, to produce the corresponding compounds which contain a sulfinyl or a sulfonyl group in place thereof.

Alternatively, compounds of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contain a carboxy  
10 group can be converted to compounds containing the corresponding amide group by first converting the carboxy group into an activated ester or mixed anhydride using, for example, isobutyl chloroformate in the presence of a mild base, such as *N*-methyilmorpholine, in an aprotic solvent, such as THF, and then treating the ester with the appropriately substituted primary or secondard amine in an aprotic solvent, such as THF.

Alternatively, compounds of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contain a cyano group  
15 can be converted to the compounds containing a hydroxyamidino group by reaction with the an hydroxyamine in a polar solvent, such as DMSO. The hydroxyamine may be prepared *in situ* by first treating the hydrochloride salt of the hydroxyamine with a base, such as triethylamine.

Alternatively, of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contain a hydroxy  
20 group may be converted to the compounds containing the corresponding azide group by treating the compound with triphenylphosphine and an alkyl azodicarboxylate, for example, diethylazodicarboxylate, in an aprotic solvent, such as THF, and then displacing the activated oxygen so formed with an azide source, such as diphenylphosphorylazide, in an aprotic solvent,  
25 such as THF.

Alternatively, compounds of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contain a -NH<sub>2</sub> group  
or a -R<sub>a</sub>-NH<sub>2</sub> group may be converted to compounds containing a corresponding -R<sub>a</sub>-N(H)-

C(O)- group by reacting the compound with appropriately substituted acid halide under standard acylation conditions.

Alternatively, compounds of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contain a acid halide group (-C(O)-X where X is halo) or an activated ester group can be converted to compounds containing the corresponding -C(O)-N(H)- group by reacting the compound with the appropriately substituted primary or secondary amine under standard acylation or amide bond formation conditions.

Alternatively, compounds of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contains an primary or secondary amine group can be converted to compounds containing the corresponding aminoalkyl group in a manner similar to the conversion of formula (M) to formula (O) in Reaction Scheme 4. In particular, the amine is reacted with an appropriately substituted aldehyde to form the intermediate imine, which is then reduced by treatment with an appropriate reducing agent, such as sodium cyanoborohydride.

Alternatively, compounds of formula (Ia), formula (Ib), formula (Ic) or formula (Id), or any appropriately substituted starting material or intermediate thereof, which contain a primary or secondary amine can be converted to the compounds containing the corresponding ureido group by reacting the compound with phosgene in a manner similar to Reaction Scheme 7 above (in an aprotic solvent) to form the corresponding isocyanate, which is then reacted with the appropriately substituted primary or secondary amine.

In addition, all compounds of the invention that exist in free base form or free acid form may be converted to their pharmaceutically acceptable salts by treatment with the appropriate inorganic or organic acid, or by the appropriate inorganic or organic base. Salts of the compounds of the invention can also be converted to the free base form or to the free acid form or to another salt by methods known to those skilled in the art.

### Compounds of Formula (Ia)

A. To a solution of (2*R*,5*S*)-1-(chloro)acetyl-4-(4-fluorobenzyl)-2,5-dimethyl-piperazine (0.29 g, 1 mmol) in anhydrous DMF (5 mL) was added 4-hydroxy-3-methoxyphenylacetonitrile (0.20 g, 1.2 mmol) and potassium carbonate (0.28 g, 2 mmol, powdered). The resultant mixture was stirred at 50°C. After 15 hours analysis by analytical HPLC (HPLC on a C18 Vydac column with 20-70% acetonitrile in water gradient with 0.1% trifluoroacetic acid) showed complete consumption of starting material had occurred. The mixture was poured into water and extracted with three portions of ethyl acetate. The combined organic extracts were washed sequentially with 0.5 N aqueous KOH solution, water, then brine. It was then dried over MgSO<sub>4</sub>, filtered and concentrated *in vacuo* to afford a yellow oil. This was dissolved in ethyl acetate and treated with a solution of HCl in anhydrous ether. Filtration of the resultant solid afforded 0.38 g (85% yield) of (2*R*,5*S*)-1-((4-(cyano)methyl-2-methoxyphenoxy)methyl)carbonyl-4-(4-chlorobenzyl)-2,5-dimethylpiperazine, hydrochloric acid salt as a white solid: NMR (DMSO-*d*<sub>6</sub>) 11.5 (br s, 1), 7.6 (m, 4), 6.9 (m, 3), 4.8 (br s, 2), 4.4 (br s, 3), 4.0 (m, 1), 3.9 (s, 2), 3.8 (s, 3), 3.6 (m, 1), 3.3 (m, 2), 3.2-2.9 (m, 3) ppm.

### EXAMPLE 3

#### Compounds of Formula (Ia) and Formula (Ib)

A. To a solution of 1-((3,4,5-trimethoxyphenoxy)methyl)carbonylpiperazine (0.22 g, 0.70 mmol) in 1% acetic acid in methanol (6 mL) was added 4-cyanobenzaldehyde (0.33 g, 2.5 mmol) and sodium cyanoborohydride (0.093 g, 1.4 mmol). The resultant mixture was stirred at ambient temperature for 1.5 hours and the mixture was then concentrated of volatiles *in vacuo*.

Residue was taken up in ethyl acetate and washed with saturated aqueous  $\text{NaHCO}_3$  solution, water, and then brine. The organic layer was separated, dried over  $\text{MgSO}_4$ , filtered and concentrated *in vacuo* to afford a yellow oil. Purification by flash column chromatography on silica gel afforded 0.21 g of 1-((3,4,5-trimethoxyphenoxy)methyl)carbonyl-4-(4-

#### EXAMPLE 4

##### Compounds of Formula (Ia)

A. To a solution of (2*R*,5*R*)-1-((4-chlorophenoxy)methyl)carbonyl-2-methyl-4-(4-fluorobenzyl)-5-((hydroxy)methyl)piperazine (0.17 g, 0.42 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (50 mL) at 0°C was added triethylamine (excess) and methane sulfonyl chloride (0.050 mL, 0.5 mmol). The resultant mixture was stirred at 0°C until consumption of alcohol was observed by TLC analysis. The mixture was concentrated of volatiles *in vacuo*. Residue was taken up in anhydrous DMF (5 mL) and K<sub>2</sub>CO<sub>3</sub> (excess) added, followed by tetrazole (0.050 g, 0.71 mmol). The resulting mixture was stirred at ambient temperature for 3 days and filtered. The filtrate was concentrated *in vacuo* and the residue taken up in ethyl acetate. This was washed with water then brine, then dried over MgSO<sub>4</sub> and concentrated *in vacuo* to afford a yellow oil. Purification by flash column chromatography on silica gel afforded 25 mg of (2*R*,5*R*)-1-((4-chlorophenoxy)methyl)carbonyl-2-methyl-4-(4-fluorobenzyl)-5-((tetrazolyl)methyl)piperazine as a white solid: NMR (CDCl<sub>3</sub>) 7.3 (m, 5), 7.0 (m, 4), 4.8-4.1 (m, 5), 3.8 (m, 3), 3.2 (m, 2), 2.8 (dd, 1), 2.5 (dd, 1), 1.4 (d, 3) ppm, MS (ESI) 458.

To a solution of (*trans*)-1-((4-chloro-2-carboxyphenoxy)methyl)carbonyl-2,5-dimethyl-4-(4-fluorobenzyl)piperazine (0.217 g, 0.50 mmol) in a solution of tetrahydrofuran (5 mL) at 0°C was added isobutyl chloroformate (0.075 g, 0.55 mmol) and *N*-methylmorpholine (0.0556 g, 0.55 mmol). The resulting mixture was stirred at 0°C for 20 min, resulting in formation of a white precipitate. A solution of methylamine in tetrahydrofuran (0.25 mL, 2.0 M, 0.50 mmol) was then added and the mixture stirred for 30 min more, at which time it was concentrated of volatiles *in vacuo*. In the following examples, 293MR cells are utilized. These are human embryonic kidney cells (HEK293) which were stably transfected to express human CCR1 receptor by the following procedure: HEK293 cells were obtained from the American Type Culture Collection (ATCC CRL 1573). Human CCR1 cDNA was provided through collaboration with Dr. Stephen Peiper of the University of Louisville, Kentucky. The CCR1 gene was subcloned using standard techniques (see, e.g., *Molecular Cloning: A Laboratory Manual*, 2nd Edition, Cold Spring Harbor Laboratory Press, 1989) into a standard plasmid containing the SV40 promoter and enhancer. The plasmid also contained hygromycin and puromycin resistance genes. Calcium phosphate transfection standard protocols were used to insert the plasmid into the HEK293 cells. Cells were selected for stable expression of CCR1 using hygromycin and puromycin selection. Cells were tested for the ability to bind  $^{125}\text{I}$ -labelled RANTES or MIP-1 $\alpha$  with high affinity.

#### EXAMPLE 24

##### *In Vitro* Assay: Calcium Flux

Since the CCR1 receptor, in common with other seven transmembrane G-protein coupled receptors, responds to the binding of its ligand, e.g., MIP-1 $\alpha$  and RANTES, by mobilizing free intracellular calcium, one can measure biological activity by calcium flux assays using the fluorescent dye Fura 2. In the following assay, the ability of the compounds of the invention to block this biologic response is measured.

##### Protocol:

- 1) Two flasks of 293MR cells were detached, washed and resuspended in Hanks  $\text{Ca}^{2+}$  (50 mL Hanks, 1.0 mL 1 M Hepes, 1.6 mL 500 mM  $\text{CaCl}_2$ , pH 7.4). The cells were washed twice in this media.
- 2) The cells were counted  $\text{CCR1} = 28 \times 10^6$  cells made to  $2 \times 10^6$  cells/mL by suspending into 14 mL Hanks  $\text{Ca}^{2+}$ .
- 3) To 10 mL of the cells ( $20 \times 10^6$ ) was added 30 mL of media (containing 50  $\mu\text{g}$  of Fura in 50  $\mu\text{L}$  of DMSO). Final cell concentration was  $1.0 \times 10^6$  cells/mL. Final Fura concentration was 1.25  $\mu\text{M}$ .

-221-

- 4) The cells were incubated at 37°C for 30 minutes in the presence (or absence) of increasing concentrations of compounds of the invention. Cells were washed as above to remove free Fura. Cells were resuspended at  $1 \times 10^6$  cells/mL. Cells were then aliquoted (2.0 mL) in a cuvette and placed in a spectrofluorimeter. The cells were then stimulated with either MIP-1 $\alpha$  or RANTES (Peprtech Inc.) and Ca<sup>2+</sup> release was measured in the spectrofluorimeter.
- 5) The data were corrected for nM Ca<sup>2+</sup> released by adding 100  $\mu$ L of 0.1% Triton X-100 (for maximum values) followed by 100  $\mu$ L of 500 mM EGTA, pH 8.5 (for minimum values).
- 10 The compounds of the invention, when tested in this assay, demonstrated the ability to inhibit the Ca<sup>2+</sup> mobilization in response to binding of MIP-1 $\alpha$  and RANTES to the CCR1 receptor.

#### EXAMPLE 25

##### *In Vitro Assay*

- 15 The assays were performed in a microphysiometer to investigate the functional activity of the antagonist of interest. The microphysiometer assesses cellular response through the use of a silicon-based potentiometric sensor that can measure small changes on solution pH (Hafeman *et al.*, *Science* (1988), Vol. 240, pp. 1182-1185; Parce *et al.*, *Science* (1989), Vol. 246, pp. 243-247). It has been shown that the microphysiometer can be used for measuring metabolic rates of living cells (Parce *et al.*, 1989). The activation of cell membrane receptors can alter the rate of extracellular acidification (Owicki *et al.*, *Proc. Natl. Acad. Sci.* (1989), Vol. 87, pp. 4007-4011). The following assay demonstrates that activation of CCR1 receptors endogenously expressed on human THP-1 cells with MIP-1 $\alpha$  and RANTES induced physiological changes resulting in an increase in metabolic rates and that the compounds of the invention inhibit this effect in a dose-dependent manner.

  - b. Tissue culture medium: RPMI 1640 supplemented with 10% FBS (fetal bovine serum). This medium is hereinafter referred to as "growth medium".

Assay Procedure:

The pump cycle was 50 seconds on and 40 seconds off. Multiple data points representing metabolic rate were taken  
30 and used as baseline. Cells were exposed to the compounds of the invention for 30 minutes

#### Reagents and Solutions:

MIP-1 $\alpha$  and RANTES (Peprtech Inc.)

15 Cells: 293MR cells ( $K_D$ =1-3 nM and  $B_{max}$ =2-3 x 10<sup>6</sup> sites/cell) were detached by trypsinization and plated into flasks at least 48 hours prior to the experiment.

Ligand: <sup>125</sup>I-MIP-1 $\alpha$  and <sup>125</sup>I-RANTES from New England Nuclear (specific activity is 2200 Ci/mmol, 25  $\mu$ Ci/vial) was reconstituted in 1 mL H<sub>2</sub>O.

20 Assay buffer: 130 mM NaCl, 5 mM KCl, 1 mM MnCl<sub>2</sub>, 50mM Tris, 30  $\mu$ g/ml bacitracin, 0.1% BSA, pH 7.4.

Wash buffer: Phosphate buffer solution (PBS)

Compounds of the Invention: The stock solution of the compounds was 1 mM in 100% DMSO.

25 The highest concentration in the assay was 10  $\mu$ M and may vary depending on the potency of the compounds. A serial 1:3 dilution from the highest concentration was made with assay buffer. Six concentrations of each compound were usually being screened to generate a dose curve from which the  $K_i$  value was determined.

#### Assay procedure:

Assays were performed in 96-well v-bottom microtiter plates in a total volume of 100  $\mu$ l.

-224-

293MR cells was detached from T225 cm<sup>2</sup> flask in PBS by shaking. The cells were washed once in PBS and resuspended in the assay buffer to about  $1.1 \times 10^5$  cells/mL. Cells (about 8000 cells/assay) were incubated with either <sup>125</sup>I-MIP-1 $\alpha$  or <sup>125</sup>I-RANTES (about 15,000-20,000 cpm/assay) in the presence and absence of different concentrations of compounds at ambient temperature for 30-40 minutes.

The reactions were terminated by harvesting through a GF/B filter plate presoaked with 0.3% PEI (Sigma # P-3143) plus 0.5% BSA and washing 5 times with cold PBS. The radioactivities in each well were determined by scintillation counting following addition of 50  $\mu$ l of scintillation fluid.

The nonspecific binding was defined by the binding in the presence of 100 nM of unlabeled MIP-1 $\alpha$  or RANTES. The CCR1 receptor concentration used in the assay was 0.4 nM and <sup>125</sup>I-MIP-1 $\alpha$  or <sup>125</sup>I-RANTES was 0.06 nM. The concentrations of compounds in the assay is typically from 10  $\mu$ M to 30 nM in 1:3 dilution and the concentrations for more potent compounds were lower depending on the potency.

Calculations:

The dose curves of each compound with 6 concentration points were generated and IC<sub>50</sub> values were determined by fitting the data to the log-logit equation (linear) with an EXCEL spread-sheet. The K<sub>i</sub> values were then calculated by dividing the IC<sub>50</sub> by 1.025, to correct for concentration of labelled ligand.

The compounds of the invention, when tested in this assay, demonstrated their affinity to bind to the CCR1 receptor.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/EP 98/03503

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☒ Claims Nos.: 32, 34-39, 42  
because they relate to subject matter not required to be searched by this Authority, namely:  
see FURTHER INFORMATION sheet PCT/ISA/210
2. ☒ Claims Nos.: 1-5, 7, 9, 12-15, 18-22, 24-29, 31, 33, 40, 41, 43-45 (incomplete)  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

see additional sheet

1. ☒ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☒ No protest accompanied the payment of additional search fees.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Although claims 32, 34-39, 42 are directed to a method of treatment of the human/animal body, the search has been carried out and based on the alleged effects of the compound/composition.

-----

Claims Nos.: 32,34-39,42

Rule 39.1(iv) PCT - Method for treatment of the human or animal body by therapy

-----

Claims Nos.: 1-5,7,9,12-15,18-22,24-29,31,33,40,41,43-45 (incomplete)

In the designated claims, the number of possible combinations of variables is very large, and some of the definitions are not properly defined (e.g. "heterocyclyl", "aryl"), so that an exhaustive and complete search was not possible for practical and economic reasons. Guided by the description and the spirit of the application, the claims in question have been searched have been searched mainly, but not exclusively, with regard to the preferred embodiments and examples mentioned in the description.

(Cf. Arts. 6, 15, and Rule 33 PCT, Guidelines Exam. B III, 3.6, 3.7.)

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

This International Searching Authority found multiple (groups of) inventions in this international application, as follows:

1. Claims: 1-32

Compounds of formula (Ia) wherein at the "right-hand part" of the molecule a phenylmethyl group is attached and the piperazine must have at least one substituent at a carbon atom (group R1a); pharmaceutical compositions containing these compounds.

2. Claims: 33-39

Pharmaceutical compositions containing compounds of formula (Ib) which do not have a substituent R1a (no substituent at carbon atoms of the piperazine ring).

3. Claims: 40-42

Compounds of formula (Ic) wherein one of the N atoms of the piperazine ring is a quaternary nitrogen, the piperazine ring being optionally substituted, and pharmaceutical compositions containing these compounds.

4. Claims: 43-46

Compounds of formula (Id) wherein the "right-hand part" is substituted by a heterocycle; and pharmaceutical compositions containing these compounds.
